

MatchControl

Mass mailings customised and controlled

You send thousands of business or commercial letters and do not have any control if there are the right inserts in the letter, do you? Using the document recognition system those processes can be automated efficient, reliable and flexible.

The System monitors the enveloping of personalised documents with custom-made inserts by means of intelligent image processing. This solution is suitable mainly for lettershops, catalogue companies, insurances, banks, communication services and for any further companies with a high amount of business or commercial letters and attach great importance to specific inserts or contents.

MatchControl reads and recognises codes and processes the information for parallel reading of inserts and envelopes. Correctly fitted mails go through the process and whereas wrongly enveloped ones are sorted out.

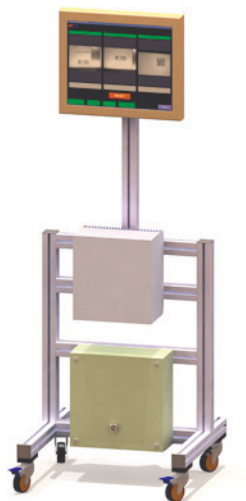

If, for example, code changes have to be processed (post code or box change) the system recognises them and enables to check and control the processing.

A high standard of document protection and production safety is guaranteed due to the intelligent document tracking over the whole enveloping track and the individual control of insert feeding.

Each camera is able to process up to five reading windows with different inserts and to assume another reading task as well as to recognise plain text (with OCR), control characters (with OMR), barcodes or 2D codes.

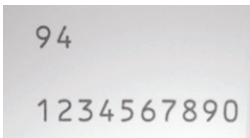

Additionally, a read & print function enables to print the envelopes with the correct address to the fitting insert.

Up to five individual configured insert stations can be fitted with cover letters, personalised inserts or information material and controlled at the same time. Using MatchControl 30.000 mails per hour can be enveloped. Operating the system is simple and comfortable. The whole system configuration is carried out by a central touchscreen panel with intelligible operation. All of the setting data are storable and available for repetitive jobs.

Mass mailings customised and controlled

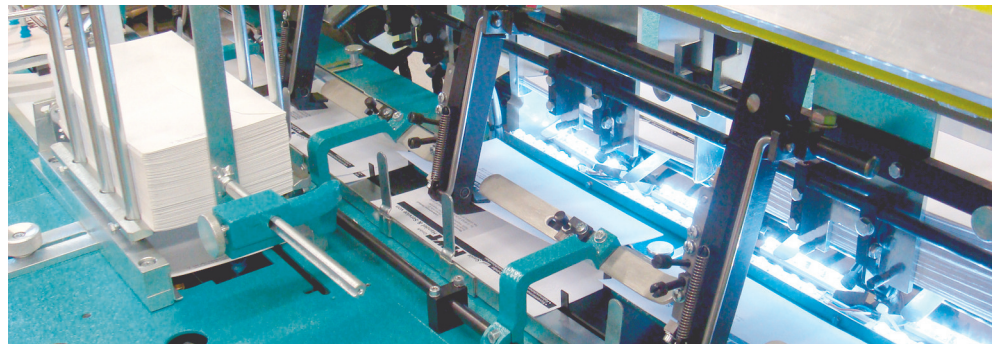

Advantages

- Customer-specific feeding solutions
- Customised inserts (letters, information material, messages)
- Sort out wrongly enveloped mails
- Quality intensification using visual control
- Safe investment because of a simple system integration into other systems
- Upgrading of existing systems about the intelligent visual quality control
- Integration of in-house data for parallel reading and printing
- Modular hard- and software design for a reasonable enlargement or fitment
- Simple and intuitive operation

Technical data

- Reading of plain text (with OCR), control characters (with OMR), barcodes and 2D codes
- Adress reading (optional)
- Read & Print function
- Processing of up to 30.000 mails per hour
- Use of up to five reading stations
- Each reading station can read up to 5 different codes or texts, free configurable for each station
- Image resolution 300 dpi
- Power supply 230 V
