

VarioMail Desktop

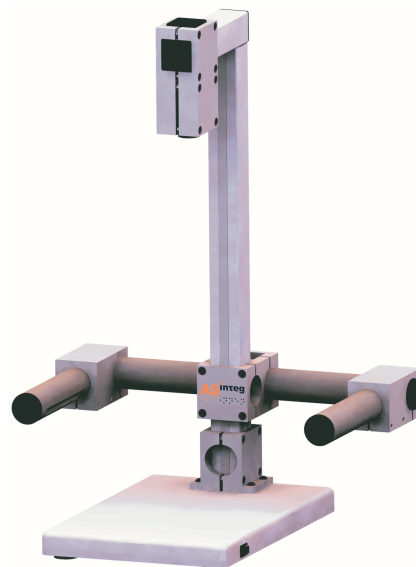

Manual entry easily-made

ASinteg offers a system solution by which letters and parcels can be processed simply and fast by hand at a working place. The solution is suitable for postal delivery services, which customers mainly take small sending amounts or for companies generating only small mailing sizes. The system is used also for processing the inbox and outbox in post offices of companies, insurances, financial service providers and authorities. For the processing the document or postal item formats don't matter.

The system consists of an image capturing desk as well as a standard personal computer and can be complemented by a label printer. An integrated recognition software identifies the postal items and stores the data in a database.

VarioMail Desktop reads and records addresses, barcodes and 2D codes. Additionally, the way of delivery can be determined, daily lists created and postal items investigated by means of postal addresses, period or barcodes. The acquiring of undeliverable mails (returns) and the data storage on customer-specific systems are to be implemented simply. The accessibility to subsequent mail specific software solutions is guaranteed.
